

AUTISM: THE MARTIANS IN DISGUISE?

Article by fellow AuDHD'er Martian/Stefano Ark/Jesus Apollo

Autism and therapies, let's delve deeper into the connection between Autism and medicative therapies for the middle and temporizable phantom areas of the hemisphere of Autism that affect concentration, executive functioning and prolonged dopaminergic release across the mind and animal/electron function, this is why many people with Autism and ADHD (ADHD) and Autistic Spectrum individuals feel "Alien" or "MARTIAN". I propose the theory that most Audhd individuals are Martian, a mix between human and a dependent species of Martian. As you can observe with Autistic individuals, they struggle with adapting to their earthly environment, speaking a language that seems of speciality and species norm to themselves but foreign to that of a full hominid origin. I propose that Autism struggle with allergy, epilepsy and cognitive differences are subject to being in an atmosphere that may seem foreign to them, Earth. If we look at the atmospherical nature of Mars, lights and skin plus cardiovascular function of autistics, they seem to be foreign to their environment, almost as if parts of the earth are having an impact on their biology and the autistic and Audhd, ADHD having to adapt to their environment and atmosphere with the help of anti allergens, medicative therapies and a tailored diet to allow this to happen. This is; suggestive of a difference to their Earthly environment, that as many would say, is not of this Earth but instead of a differential civil action, cool and interesting? Agreed, this is very interesting indeed.

Let's delve into the middle lobe, back and spine In the autistic individual and the infamous D2 receptor. This receptor stores in cognitive emotional cellular data which is of a monumental diastrophical membrane origin; to link this to the previous point raised in the sentence adjacent to this, I believe that the back has a close link to the dopamine areas of the King brain receptors and the Queen brain receptors in the back and the Duke receptors of the stomach- I use this analogy as it helps to give a hierarchical understanding of the bodily functions ,of, the biological information router that is the body. This is important when understanding the autistic mind and moving the focus away from the Autistic being solely neurodivergent and more towards the autistic or Audhd being a species; with many autistic individuals reporting musculoskeletal differences and injuries. These injuries have been reported to affect the cognitive functioning of the autistic, especially issues within the neck area, with low functioning autistics requiring bone maneuvers such as exercises of the neck and spinal vicinity. This might suggest the body of the autistic behaving and presenting in a different way to the neuro typical with many bodily issues such as Epilepsy, Musculoskeletal differences, allergies being a common occurrence and physiological identifier within individuals on the autism spectrum; meaning that the autistic individual should be looked into as a

“whole” being rather than an individual with sole neurodivergent differences, which means that the common physical issues in which occur within Autism may be an identifier of the autistic individual being of human and MARTIAN decent

To summarise lets look into the MARTIAN identifier, I have proposed that this means the bodily origins of a group of individuals, align with a bodily composition that is of a differential descent (neurodivergence) using this identifier scale it may be of better suit to study how to better integrate neurodivergent individuals into society, with up to 80 percent of Autistics being unemployed or struggling to function in a world that seems “Alien” to them. Having Autistics looked as a “whole” when assessing their support rather than focussing on social communication will help provide better diagnosis and assessment outcomes, with many autistics living life in a tense struggle predicament due to misdiagnosis or the ignorance of diagnosis due to their appearance not aligning with the stereotypical view of how an autistic should look like. Looking into Autism as a “whole identifier” considering their biological differences and allusion to common medical diagnosis such as epilepsy- rather than dismissing the importance of physical health issues when assessing will create better treatment outcomes. This missing specifiers from the DSM V has historically put us in danger of being wrongfully hospitalised with governments looking into ways of creating a better integrated society for autism, the “MARTIAN” paradigm and look at autistics, aside from being “cool” and interesting, allows scientists like myself to better evaluate the occurrence and link autism has to frequency, music and sound with autistics using sensory lights, glasses, stoic alone time as a way of being themselves; with many of them having a common knowledge and grips to the cosmos, numeracy and Universal sounds; this may be as to why autistics being more prone to sensory overdrive when their environment does not suit their sensory needs.
